How to remove SageMaker endpoints and Shutdown Notebook Instance

To Remove EndPoints

When you deploy a model endpoint, the endpoint is available for prediction queries 24x7. So, you will incur charges if you leave them running beyond your free-tier limits.

For development and testing, clean-up the endpoint after you are done with your testing.

1. Logon to AWS Management Console

2. Open **SageMaker** Console

3. From Navigation Pane, select **EndPoints**

4. Select the EndPoint you would like to delete and from **Actions** remove the endpoint

To Stop the Notebook instance

1. Logon to AWS Management Console

2. Open SageMaker Console

3. From Navigation Pane, Select **Notebook**

4. Select the Notebook instance you would like to stop. Under **Actions**, select **Stop** to shutdown the instance
